

Beehive Database Server Installation

Before installing the Beehive Database Server, please consider the following

1. It is best if you close any running instances of Contact Manager and Beehive Database Server before running the installer (Server> Right-click tray icon at bottom right of screen and select 'Exit').
2. The Beehive Database Server Installer will install the Beehive Database Server and the Data Files required by the server on the server computer.
3. The Beehive Database Server Installer will NOT overwrite your data files when re-installing or upgrading.
4. The Server should be installed on your organizations 'Server' computer or one of the fastest computers within your network.
5. When un-installing the Beehive Database Server, the Data Files will NOT be un-installed.

Important Note

When re-installing or upgrading Beehive Database Server, changing the installation path from the initial installation path will generate a new data file location which does not reflect the initial data location. This means that Contact Manager will NOT show your original data until a manual modification is made. Contact Beehive Systems for instruction on this process. It is recommended that you maintain the original installation path.

Path structure of default server installation:

```
C:\Program Files\Beehive Systems
+---Contact Manager
\---Database Server
    \---Contact Manager
        +---Common
        +---Data
        +---Private
        \---Sample
```

Backup

Your backup regime should include:

```
C:\Program Files\Beehive Systems\Database Server\Licence.nx1
C:\Program Files\Beehive Systems>Contact Manager\Common\*.
C:\Program Files\Beehive Systems>Contact Manager\Data\*.
C:\Program Files\Beehive Systems>Contact Manager\Private\*.

```

Note: 'C:\Program Files\Beehive Systems' may not be your installation path
